Mitochondrial Mechanisms of Photobiomodulation in Context of New Data About Multiple Roles of ATP

Tiina Karu, Dr. Sci., Ph.D.

This article summarizes the literature that investigated the cellular responses to laser irradiation. It highlights the importance of

- Mitochondria and Cytochrome C
- ATP

iEnovis

Pubmed

- **Mitochondria** are the initial site of light action in cells, and cytochrome c oxidase (the terminal enzyme of the mitochondrial respiratory chain) is the responsible molecule.
- Mixed-valence copper components of cytochrome c oxidase,
 CuA and CuB, are believed to be the photo-acceptors.
- The excitation of the photo-acceptor molecule sets in motion cellular metabolism through cascades of reactions called cellular signalling or retrograde mitochondrial signalling.
- At least two reactions are starting points for monitoring cellular-signalling reactions after light action on the cytochrome c oxidase molecule.
 - One of them is dissociation of **NO** from the catalytic center of cytochrome c oxidase.
 - Another signalling pathway starting from the mitochondria is connected with ATP.

PHOTOBIOLOGY OF LOW-POWER LASER EFFECTS

Tiina Karu

Laser Technology Center of the U.S.S.R. Academy of Sciences, 142092 Moscow Region, Troitsk, U.S.S.R.

Abstract—Quantitative studies have been performed to determine the action of low-intensity visible monochromatic light on various cells (E. coli, yeasts, HeLa, Chinese hamster fibroblasts and human lymphocytes); also irradiation conditions (wavelength, dose and intensity) conducive to vital activity stimulation have been examined. Respiratory chain components are discussed as primary photoacceptors. The possible ways for photosignal transduction and amplification are discussed. It is proposed that enhanced wound healing due to irradiation with low-intensity visible laser light (He-Cd, He-Ne and semiconductor lasers) is due to the increasing proliferation of cells.

This article discusses the biological processes of photobiomodulation.

- Respiratory chain components are discussed as primary photoacceptors.
- The possible ways for photo-signal transduction and amplification are discussed.
- It is proposed that enhanced wound healing due to irradiation with low-intensity visible laser light is due to increasing proliferation of cells.

iEnovis

Pubmed

- Laser biostimulation is a photobiological phenomenon
- Primary photo-acceptors are components of the respiratory chain. This explains the universality of low-power laser effects.
- The respiratory chain components can be the photoacceptors in the case of cellular metabolism stimulation, as well as inhibition depending on the dose of light. At low doses, irradiation causes redox regulation of cellular metabiolism; at high doses photodynamic damage prevails.
- Light quantum is only a trigger for cellular metabolism regulation. This explains the low doses and intensities needed.
- The magnitude of the biostimulation effect depends on the physiological state of the cell before irradiation. This explains why biostimulation effect isnot always possible.
- The therapeutic effects of low-power laser irradiation can be explained by an increase of proliferation of G₀ and G₁ cells or by changes in the physiological activity of excitable cells.

- Design: Animal study
- Subjects: 33 Sprague-Dawley rats
 - Sham surgery (n=13)
 - SNI surgery (n=13)
 - SNI surgery + PBM treatment (n=7)
- <u>PBM (980 nm) protocol</u>:
 - Affected hind paw: 1 W, 20 s, 41cm above skin, dose 20 J
 - Dorsal root ganglia: 4.5W, 19s, skin contact, dose 85.5 J
 - Spinal cord regions 1.5 W, 19s, skin contact, dose 28.5 J
 - Every other day from day 7-30 post-operatively.
- Results:
 - Injured groups demonstrated mechanical hypersensitivity 1-30 days postoperatively.
 - Photobiomodulation-treated animals began to recover after two treatments; at day 26, mechanical sensitivity reached baseline.
 - Peripheral nerve injury caused region-specific macrophages/ microglia activation along spinothalamic and dorsal-column medial lemniscus pathways.
 - A pro-inflammatory microglial marker was expressed in the spinal cord of injured rats compared to photobiomodulation-treated and sham group.
 - Photobiomodulation-treated dorsal root ganglion macrophages expressed anti-inflammatory markers.

CONCLUSION

This review provides strong evidence in neuroscience identifying inhibition of neural function as a mechanism for the clinical application of PBM in pain and anesthesia.

iEnovis

Pubmed

<u>Design & purpose</u>: Review of electrophysiological studies in humans and animal models and cell culture studies to examine neural responses to PBM.

Results:

- Evidence shows that PBM can inhibit nerve function in vivo, in situ, ex vivo, and in culture.
- Animal studies using noxious stimuli indicate nociceptor-specific inhibition with other studies providing direct evidence of local conduction block, leading to inhibited translation of pain centrally.
- Evidence of PBM disrupted neuronal physiology affecting axonal flow, cytoskeleton organization, and decreased ATP is also presented.
- PBM changes are reversible with no side effects or nerve damage.

CONCLUSION:

The evidence supports the view that neural inhibition is a plausible mechanism for the relief of acute and chronic pain with LLLT.

iEnovis

Pubmed

Design: Systematic review.

 44 studies were suitable for inclusion, 18 human and 26 animal studies.

Results:

- In 13 of 18 human studies, pulsed or continuous wave visible and continuous wave infrared (IR) laser irradiation slowed conduction velocity (CV) and/or reduced the amplitude of compound action potentials (CAPs).
- In 26 animal experiments, IR laser irradiation suppressed electrically and noxiously evoked action potentials including pro-inflammatory mediators.

Rodney Capp Pallotta · Jan Magnus Bjordal · Lúcio Frigo · Ernesto Cesar Pinto Leal Junior · Simone Teixeira · Rodrigo Labat Marcos · Luciano Ramos · Felipe de Moura Messias · Rodrigo Álvaro Brandão Lopes-Martins

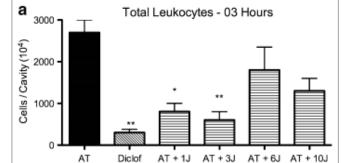

- Design: animal study (30 Whistar rats)
- Methods: knee joint inflammation was induced with
- Results:
 - Significant reduction of the number of leucocytes and neutrophils in the joint cavity
 - Significant reduction of pro-inflammatory mediators (IL-1, IL-6) implicated in cartilage degeneration

CONCLUSION:

The results suggest that laser radiation could acting to modulate the inflammatory possibly to stimulate the process and production of anti-inflammatory mediators.

The anti-inflammatory mechanism of low level laser therapy and its relevance for clinical use in physiotherapy

Jan Magnus Bjordal, Rodrigo Alvaro Brandão Lopes-Martins, Jon Joensen & Vegard Vereide Iversen

CONCLUSION:

There is strong evidence that red and infrared LLLT has a dose-dependent anti-inflammatory effect in animals, and scant evidence that the anti-inflammatory effect also occurs after LLLT in humans. The magnitude of the effect is not significantly different from NSAIDs

iEnovis

Journal link

Design: Systematic review

<u>Studies</u>: 11 cell studies and 27 animals studies met all inclusion criteria, and another 6 animal studies met the inclusion criteria for drug comparisons and LLLT interactions.

Results:

- There is strong evidence of an anti-inflammatory effect from LLLT, which is consistent across all 12 tested laboratory models and phases of inflammation and wavelengths between 633 and 904 nm.
- The magnitude of the anti-inflammatory effect is not significantly different from that of non-steroidal anti-inflammatory drugs (NSAIDs), but it is slightly less than glucocorticoid steroids.
- There is moderate evidence that concomitant use of glucocorticoid steroid has a negative effect on LLLT mechanisms and should be avoided.

Molecular mechanisms of LPLI induced cell proliferation involve a number of signalling proteins, cell cycle-specific proteins and other molecules such as growth factors, interleukins, inflammatory cytokines and other small molecules.

iEnovis

Pubmed

This study discusses the discovered mitochondrial photoacceptors and nonmitochondrial photoacceptors, and then reviews the studies on the molecular mechanisms of LPLI-induced proliferation since January 1999, which will serve as a reference for the researchers in this field

- A number of signalling proteins are involved with laser-induced cell proliferation.
- Laser irradiation can regulate cell cycle progression by by the activation or elevated expressions of cell cycle-specific proteins.
- Laser irradiation reduces signal molecules involved in inflammatory response and enhances immunomodulatory effects.
- Laser irradiation induces expression and secretion of growth factors, interleukins, inflammatory cytokines and small molecules (such as ATP, ROS, intracellular Ca²⁺).

Low level laser irradiation promotes cell proliferation and production of mRNA for type I collagen and decorin synthesis.

iEnovis

Pubmed

Design: Laboratory study

<u>Methods</u>: 4 groups of identically cultured fibroblasts were exposed to LLLI and harvested after 24 h.

- Group 1 (control group) received no LLLI.
- Group 2 received 1 J/cm2 LLLI
- Group 3 received 2 J/cm2 LLLI
- Group 4 received 3 J/cm2 LLLI

Results:

- When compared to the control group, the cell proliferation of irradiated AT fibroblasts in the other 3 groups increased significantly by 13% (Group 2), 30% (Group 3), and 12% (Group 4) respectively.
- The mRNA expressions of decorin and type I collagen in fibroblasts with LLLI were significantly higher than in the control condition (p < 0.05).

LITERATURE REVIEW

Effects of Low-Level Laser Therapy on Skeletal Muscle Repair

A Systematic Review

The main effects of LLLT in muscle injuries were a reduction in the inflammatory process, the modulation of growth factors and myogenic regulatory factors, remodelling of extracellular matrix, and increased angiogenesis.

iEnovis

Pubmed

<u>Design</u>: Systematic review of 17 studies on the use of LLLT for the repair of skeletal muscle in any animal model.

Results:

- LLLT has been shown to be an extremely efficient therapeutic resource for the modulation of the inflammatory process and the attenuation of oxidative damage after muscle injury.
- LLLT has shown promise in **modulating MRFs** (myogenic regulatory factors).
- LLLT has been shown to be effective in modulating the formation of fibrotic tissue during the repair of injured muscle tissue. It has been shown to be effective in reducing the gene expression of TGF-β which plays a key role in the initiation of fibrotic cascades and the differentiation of satellite cells into myofibroblasts in injured muscle.
- LLLT is extremely effective in modulating the expression of VEGF mRNA and the consequent formation of new blood vessels during the repair of injured skeletal muscle.

Lasers in Medical Science 28, 725-734 (2013) Cite this article

This study showed that LLLT could modulate the homeostasis of ROS (reactive oxygen species) and of the growth factors IGF-1 and TGF- β 1, which are known to play important roles in the repair process. This may constitute a new preventive approach to muscular fibrosis.

iEnovis

Pubmed

<u>Methods</u>: Adult male Sprague-Dawley rats (n=96) were randomly divided into three groups: control group (no lesion, untreated, n=6), contusion group (n=48), and contusion-plus-LLLT group (n=42).

Muscle remodelling was evaluated at 0 h and 1, 2, 3, 7, 14, 21, and 28 days after injury.

Results:

- LLLT markedly promoted the regeneration of muscle and reduced scar formation.
- LLLT also significantly enhanced muscle SOD (muscle superoxide dismutase) activity and significantly decreased muscle MDA (malondialdehyde) levels 1, 2, and 3 days after injury.
- LLLT increased the expression of IGF-1 2, 3, and 7 days after injury and decreased the expression of IGF-1 21 and 28 days after injury.
- LLLT decreased the expression of TGF-β1 3 and 28 days after injury but increased expression at 7 and 14 days after injury.

Laser irradiation had a positive biostimulation effect on chondrocyte cell proliferation which was maintained for five days following the laser treatment.

Pubmed

Design: In vitro study.

<u>Methods</u>: Chondrocyte cultures were derived from rabbit and human cartilage.

- These cells were exposed to laser treatment for 5 days, using the following parameters: 300 joules, 1 watt, 100 (treatment A) or 300 (treatment B) hertz, pulsating emission for 10 minutes, under a sterile laminar flow.
- Control cultures (no treatment) received the same treatment with the laser device off.

<u>Outcome</u>: Cell viability was measured by MTT assay at the end of the laser treatment and then after 5 days.

Results:

- Neither rabbit nor human cultured chondrocytes showed any damage under a light microscope and immunostaining control following laser treatment.
- The MTT test results indicated a positive biostimulation effect on cell proliferation with respect to the control group.
- The increase in viability of irradiated chondrocytes was maintained for five days following the end of the laser treatment.

Laser irradiation provides biostimulation to chondrocytes without cell damage

iEnovis

Pubmed

Design: In vitro study.

<u>Methods</u>: The cartilage sample used for the biostimulation treatment was taken from the right knee of a 19-year-old patient. After the chondrocytes were isolated and suspended for cultivation, the cultures were incubated for 10 days. The cultures were divided into four groups.

- Groups I, II, III were subject to biostimulation with the following laser parameters: 300 J, 1 W, 100 Hz, 10 min. exposure, pulsating emission; 300 J, 1 W, 300 Hz, 10 min. exposure, pulsating emission; and 300 J, 1 W, 500 Hz, 10 min. exposure, pulsating emission, respectively.
- Group IV did not receive any treatment. The laser biostimulation was conducted for five consecutive days.

<u>Outcomes</u>: At the end of the treatment, the Calcium, Alkaline Phosphate, MTT tests and proteoglycan were performed to assess cell metabolism and toxicity level.

Results

The data showed good results in terms of cell viability and levels of Ca and Alkaline Phosphate in the groups treated with laser biostimulation compared to the untreated group.

CONCLUSION:

Pain and quality of life significantly improved when HPL is combined with exercises, compared to placebo laser treatment or exercises only.

iEnovis

Pubmed

- <u>Design</u>: Double-blind randomised placebo controlled trial
- <u>Subjects</u>: 36 patients diagnosed with adhesive capsulitis
 - HILT plus therapeutic exercises
 - Sham-laser plus therapeutic exercises
 - Control: therapeutic exercises only
- Device: Mectronic iLux
- HILT Protocol:
 - 100J/cm², 8-12 W in stochastic and burst mode
 - Scanning over anterior & posterior joint line
 - 5 sessions / week for 3 weeks (15 sessions in total)
- Results:
- Only HILT plus therapeutic exercises group showed significant decrease with time of the VAS-pain score and significant improvement of all SF-36 subscores over time, except for subscore emotional well-being.
- At the end of the study, there was a significant (p<0.05)
 difference in VAS-pain, SPADI-pain, and SF-36 (subgroups of
 energy/fatigue, pain, and general health) scores in favour
 of the HILT plus ex. group compared to the other groups.
- All groups provided comparable improvements in SPADIdisability and ROM of shoulder joint after the interventions and during the follow-up (all P < 0.05).

Long-Term Effect of Pulsed Nd:YAG Laser in the Treatment of Patients with Rotator Cuff Tendinopathy:

A Randomized Controlled Trial

Ahmed Mohamed Elsodany, PhDPT, Mohamed Salaheldien Mohamed Alayat, PhDPT, Mohamed Mohamed Ebrahim Ali, PhDPT, and Hussien Mosa Khaprani, MscPT³

CONCLUSION:

Adding HILT to active exercise therapy is of clinical significance for improving symptoms associated with rotator cuff tendinopathy and this positive impact lasts for 6 months.

Pubmed

Figures

- <u>Design:</u> Randomised placebo controlled trial
- <u>Subjects</u>: 60 patients with rotator cuff tendinopathy
 - HILT + exercise group (n=30)
 - Sham HILT + exercise group (n=30)
- <u>Device</u>: ASA Hiro 3
- HILT Protocol:
 - total dose per session: 2050 J
 - 3 sessions / week for 4 weeks (12 sessions in total)
 - Average power: 10.5 W
- Results:
 - Pain, ROM and shoulder function improved significantly in both groups after treatment and at follow-up intervals (p<0.001).
 - The improvements were significantly higher in the HILT group compared to the control group.
 - There was a significant difference between HILT group and control group for all outcome variables at all time points (post-treatment, 3m, 6m) in favour of the HILT group (p<0.001).

Effectiveness of Photobiomodulation Therapy in the Treatment of Myofascial Pain Syndrome of the Upper Trapezius Muscle: A Systematic Review and Meta-Analysis

Mohamed Salaheldien Mohmed Alayat, PhD PT,^{1,2} Kadrya Hosney Battecha, PhD, PT,^{1,2}
Ahmed Mohamed Elsodany, PhD PT,² Omer Abdulaziz Alzahrani, BSc,¹
Abdulmajeed Khalaf Allah Alqurashi, BSc,¹ AbdulAziz Talal Jawa, BSc,¹ and Yazan Saleh Alharthi, BSc,¹

Conclusion:

PBMT is an effective treatment modality for myofascial pain syndrome with significant effects compared to controls.

iEnovis

PubMed

<u>Design</u>: systematic review with meta-analysis

- 17 studies included in the review
 - 16 included in the meta-analysis
 - 3 HILT studies
 - 12 high quality studies (PEDRO)
 - 8 studies (441 patients) compared 'PBMT alone' with control treatment (placebo /medication /other PT / manual therapy).
 - 7 studies (421 patients) compared 'PBMT + Exercise' with control treatment.

Results:

- PBMT and PBMT+Ex were significantly more effective than control or comparator groups post-treatment and at follow-up for pain reduction and increase of PPT (pain pressure threshold)
- PBMT: medium effect size
- PBMT+Ex: large effect size

CONCLUSION:

HILT as a complementary modality to exercise or conventional physical therapy may offer significant additional pain relief and functional improvement.

- *Design*: Systematic review with Meta-analysis
- Studies: 10 RCTs met the inclusion criteria
 - 4 studies on neck pain
 - 6 studies on low back pain
- <u>Results</u>: Forest plots showed that
 - HILT with exercise was significantly more effective than placebo HILT with exercise in terms of pain reduction and functional improvement.
 - HILT alone or HILT with conventional physiotherapy (CPT) provided significantly better outcomes than CPT alone.

Effects of Class IV Laser Therapy on Fibromyalgia Impact and Function in Women with Fibromyalgia

Lynn Panton, PhD, FACSM, Emily Simonavice, PhD, Kristen Williams, MS, Christopher Mojock, MS, Jeong-Su Kim, PhD, J. Derek Kingsley, PhD, Victor McMillan, MD, and Reed Mathis, DC

CONCLUSION:

HILT may be a beneficial modality for women with fibromyalgia. It produced significantly greater improvements in pain and upper-body flexibility than placebo treatment, ultimately reducing the impact of fibromyalgia.

iEnovis

Pubmed

- <u>Design</u>: Double-blind randomised placebo controlled trial
- Subjects: 38 women with fibromyalgia
 - Laser heat therapy: HILT + warm air (n=20)
 - Placebo: warm air only (n=18)
- Device: Litecure LCT-1000
- HILT Protocol:
 - 10.63 J/cm², total dose per session 4200J
 - Grid scanning technique over 7 tender points located across the neck, shoulders and back
 - 2 sessions/week for 4 weeks (total 8 sessions)
- <u>Results</u>:
 - Pain decreased with 12.7% in the HILT group (signif.) versus 5.1% in the control group (not signif.)
 - Fibromyalgia Impact score improved with 9.5% in the HILT group (signif.) versus no change in the control group.
 - Function scores improved with 19.5% in the HILT group (signif.) versus 8.2% in the control group (signif.)
 - Upper body flexibility improved with 9.9% in the HILT group (signif.) versus no change in the control group.

CLINICAL REHABILITATION

(\$)SAGE

Nabil Mahmoud Abdel-Aal 100. Khadra Mohamed Ali2 and Hadaya Mosaad Eladl²

- Design: Double-blind randomized controlled trial.
- Subjects: 50 patients with arthropathy of the hands
 - Experimental group received HILT plus the routine physical therapy program. Total energy delivered per session was 2100 J.
 - The control group received sham HILT plus the same routine physical therapy program.
- Device: ASA Hiro-3
- 3 sessions/week for 8 weeks
- Results
 - Handgrip strength, joint swelling count, joint tenderness count and pain VAS improved significantly more in the HILT group compared to the sham-control group.

CONCLUSION:

Adding HILT to the routine physical therapy program might be more effective than routine PT program alone for improving handgrip strength, decreasing joint swelling counts, joint tenderness counts, and pain in patients with arthropathy of the hands.

Pubmed

Outcomes HILT Group (n=25)Sham HILT Group (n=25)Baseline After eight MD (95%CI) Baseline After eight MD (95%CI) weeks weeks Handgrip (kg) 20.84 ± 9.02 28.34 ± 8.3 -7.5 (-8.54, -6.55) 19.36 ± 8.31 22.96 ± 8.76 -3.6 (-4.55, -2.65) 5.38 (0.53, 10.23) 9.84 ± 2.23 4.4 ± 2.18 5.44 (4.92, 5.96) 10.32 ± 2.24 7.36 ± 2.14 2.96 (2.44, 3.48) swelling (n) Joint tenderness 11 ± 2.29 5 ± 2.1 6 (5.59, 6.41) 2.44 (2.03, 2.85) VAS (mm) 48.8 (44.97, 52.63) 58.8 ± 10.54 29.6 (25.77, 33.43) -23.2 (-30.2, -16.2) P < 0.001

HILT: High-Intensity Laser Therapy; CI: Confidence Interval; VAS: visual analog scale (based on 100-mm scale); MD: Mean Difference; η²: partial eta square

*Data are mean 🗈 SD, P-value < 0.05 indicate statistical significance. Negative mean difference scores (95% CI) on visual analog scale, number of joint swelling and tenderness are indicative of improvement, whereas positive change scores (95% CI) for handgrip strength indicates improvement.

Effectiveness of High Power Laser Therapy on Pain and Isokinetic Peak Torque in Athletes with Proximal Hamstring Tendinopathy: A Randomized Trial

Sachin Verma,¹ Vandana Esht,¹ Aksh Chahal,¹ Gaurav Kapoor,² Sorabh Sharma,³ Ahmad H. Alghadir,⁴ Masood Khan ,⁶ Faizan Z. Kashoo ,⁵ and Mohammad A. Shaphe ,⁶

CONCLUSION:

HPLT was effective for significantly improving pain and increasing hamstring muscle strength in athletes with PHT. Pain relief was significantly greater than with conventional PT.

iEnovis

Pubmed

- <u>Design</u>: Randomized comparative study.
- Subjects: 36 athletes with proximal hamstring tendinopathy
 - Experimental group received HILT as monotherapy.
 - 50J/cm² total energy per session was 1800 J.
 - Conventional group received conventional PT.
 - US, moist heat pack, home exercises
 - Both groups were treated 3 days / week for 3 weeks
- <u>Device</u>: Litecure LCT-1000 (810/980 nm)
- <u>Results</u>
 - Significant decrease of pain (by 61%) and increase of hamstring isokin. strength (by 13%) in HILT group
 - In conventional group, only pain decreased significantly (by 41%) while strength increase was only 1.5% and n.s.
 - Difference in pain decrease between groups (61% vs.
 41%) was significant: significantly greater pain relief with HILT.

CONCLUSION:

Photobiomodulation therapy, compared to control, is an effective adjunct treatment modality for improving pain, stiffness and function in knee OA, with HILT producing larger effects than LLLT.

CONCLUSION:

HILT plus exercise can significantly improve pain and function and increase the thickness of the hyaline cartilage.

- <u>Design</u>: Double-blind randomized controlled trial.
- <u>Subjects</u>: 40 patients with knee OA, 2 groups:
 - HILT + exercise therapy
 - Sham (placebo) laser + exercise therapy
- Device: BTL-6000
- HILT protocol:
 - 120J/cm² total 3000 J / session
 - 5 sessions / week for 2 weeks (total 10 sessions)
- Results:
 - Both groups significantly improved post-treatment
 - At 4-week follow-up, Pain VAS, WOMAC,
 Functional ROM and femur cartilage thickness
 were significantly more improved in the HILT + ex.
 group compared to the sham laser + ex. group.

Effectiveness of high-intensity laser therapy in the management of patients with knee osteoarthritis: A systematic review and meta-analysis of randomized controlled trials

Hyun Jin Song^a, Hyun-Ju Seo^{b,*} and Donghwi Kim^c
^aCollege of Pharmacy, University of Florida, Gainesville, FL, USA

Conclusion:

HILT can significantly improve pain, stiffness and function in Knee Osteoarthritis compared to placebo or other control interventions.

Design: Systematic review and Meta-analysis

Results:

- 6 randomized controlled trials (RCTs) were included in this meta-analysis.
- For **VAS pain**, 334 patients from 4 studies showed that HILT significantly decreased pain compared to the control (MD, -1.18; 95% CI, -1.68 to -0.69).
- For **stiffness**, 168 patients from 4 studies showed that HILT significantly improved WOMAC stiffness compared to the control (SMD -1.00; 95% CI -1.32, -0.68)
- For **function**, 87 patients from 4 studies showed that HILT significantly improved function compared to the control(SMD, -5.36; 95% CI -7.39 to -3.34).

Muscular Preconditioning
Using Phototherapy Improves
the Physical Work Capacity of
the Quadriceps when Applied
between Repeated Bouts of
Resistance Exercise

Borsa PA1*, Dale RB2, Levine D3 and Crow JA4

Introduction

Exercise and sports scientists are constantly searching for ways to optimize the body's response to strenuous physical activity by prolonging the ability of skeletal muscle to perform work while resisting exertional fatigue. Skeletal muscle fatigue is a rate-limiting factor for athletes who participate and compete in sports that require muscular endurance and sustained levels of strength [1]. Fatigue impairs the ability of skeletal muscle to generate force, and reduces a muscle's capacity to perform work over an extended time period [2,3]. The decrease in muscle function associated with fatigue is believed to be a result of metabolic alterations such as substrate depletion (lack of ATP and glycogen), oxidative stress, tissue ischemia/hypoxia and blood acidification [2,4]. One exponentic aid that has garneged interest

CONCLUSION:

HILT appears to reduce Quadriceps muscle fatigue for athletes requiring high levels of endurance.

Preconditioning skeletal muscle with phototherapy intermittently during recovery intervals may be a beneficial, non-invasive and safe ergogenic aid for athletes that require high levels of muscular endurance.

- <u>Design</u>: Triple-blind, repeated measures, placebo controlled, cross-over study
- Subjects: 20 healthy individuals, 2 conditions
 - HILT during recovery
 - Sham-laser during recovery
- Procedure:
 - Subjects performed quadriceps fatiguing protocol consisting of 4 high intensity exercise bouts
 - HILT or sham laser was applied during the recovery in between exercise bouts
- HILT Device: LiteCure LT-1000 810/980 nm HPL device
- HILT protocol: 10 J/cm²; total dose per session 1600-2400 J
- Result
 - HILT group was able to produce higher quadriceps torque and showed less decline of muscle performance throughout the bouts.

Figures iEnovis

Journal link

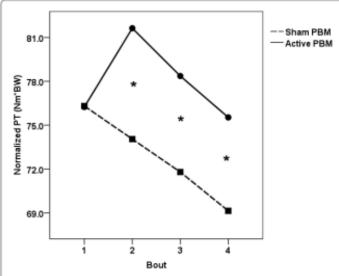

Figure 3: Normalized Peak Torque for the four exercise bouts (Marginal means). Participants produced higher peak torque (PT) during bouts 2, 3 and 4 after receiving active phototherapy compared to sham phototherapy. Asterisk denotes statistically significant difference of p ≤ 0.013.

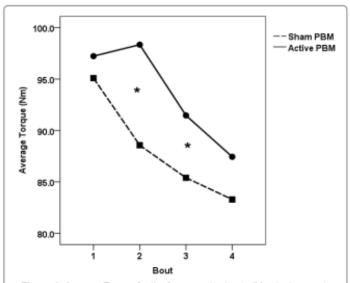

Figure 4: Average Torque for the four exercise bouts (Marginal means). Participants produced more average torque during bouts 2 and 3 after receiving active phototherapy compared to sham phototherapy. Asterisk denotes statistically significant difference of p ≤ 0.013.

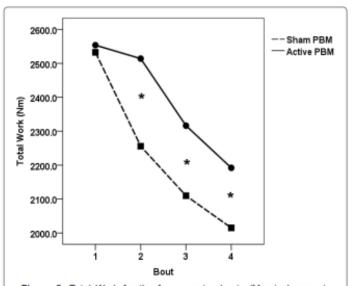

Figure 5: Total Work for the four exercise bouts (Marginal means). Participants produced more work during bouts 2, 3 and 4 after receiving active phototherapy compared to sham phototherapy. Asterisk denotes statistically significant difference of p ≤ 0.013.

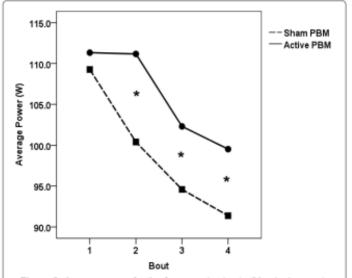

Figure 6: Average power for the four exercise bouts (Marginal means). Participants produced more power during bouts 2, 3 and 4 after receiving active phototherapy compared to sham phototherapy. Asterisk denotes statistically significant difference of p ≤ 0.013.
